

Water handling policy – UN Targets 6-12-13

Steel Products A/S is committed to minimizing its impact on the environment. One of the most critical areas of focus is water consumption. Water is a vital resource that is necessary for many of our manufacturing processes. As such, it is essential that we manage our water consumption carefully to minimize waste and ensure that we meet our sustainability objectives. In this policy, we will outline our approach to water consumption, including strategies for reducing water consumption, water filtration and reuse, and how we will support

This policy supports UN sustainability development goal number:

- **6 Clean water**
- **12 Responsible consumption & production**
- **13 Climate Actions**

Reducing Water Consumption

Our approach to minimizing water consumption is to reduce the amount of water we use in our manufacturing processes. We are achieving this through the following measures:

1. **Conduct Water Audit** - We conduct water audits to determine where water is used, the quantities used, and areas where we can reduce water consumption.
This helps us identify areas where we can implement water-saving measures.
2. **Implement Water-Saving Measures** - Based on the results of the water audit, we identify measures that help us reduce water consumption. This includes installation of water-efficient equipment and processes, such as low-flow fixtures, water-efficient washing systems, and closed-loop cooling systems.
3. **Training and Education** - We provide our employees with training and education to ensure that they understand the importance of water conservation and the role they play in reducing water consumption. This includes regular reminders to turn off taps when not in use, report

any leaks or faults, and use water efficiently in all processes.

4. Tracking and Reporting - We track and report our water consumption to ensure that we stay within our target limits. We also use this information to identify opportunities for further improvements.
Water Filtration and Reuse.

In addition to reducing our water consumption, we have implemented water filtration and reuse system. The system helps us achieve the following:

1. Increase Water Efficiency - We filter and reuse 70% of our water multiple times to increase water efficiency and reduce our water consumption.
Which reduces our overall water footprint and contribute to the sustainability of our operations.
2. Reduce Water Costs - Water filtration and reuse reduce our water costs by minimizing the need for fresh water.
In additional, this also contribute to manage our expenses and improve our profitability.
3. Improve Water Quality - By filtering and reusing water, we improve the quality of our water, which result in better manufacturing processes and end products.
